SDC HACKATHON 2026

Technical & Tools Declaration

Hosted by Xiamen University Malaysia (XMUM) AI Club

Submission Deadline: 1st November 2026

Instructions: Declare every API, cloud service, AI tool, dataset, model, and sponsor resource your team used to build the project. Complete every section; where a category does not apply, tick "No" or write "None" – do not leave it blank. Submit as a single PDF document named "SDC2026_TeamName_TechDeclaration.pdf" together with your project submission. Undeclared third-party resources discovered at judging may affect your score or eligibility.

1. Team & Project Overview

Team Name	NOVA
Project / Solution Name	EventFlow AI
Name (Leader)	Tan Le Han
Email & Phone (Leader)	+60129250451
University Affiliation(s)	Xiamen University Malaysia
Live Prototype URL	https://event-flow-ai-customer-portal.replit.app
Code Repository URL (public / access granted to judges)	https://github.com/Joycemsan328/SDC_Hackathon.git

2. Architecture & Technology Stack

2.1 System Architecture Overview

Describe how the components declared in this document connect end-to-end (e.g., user interface → backend → AI model/API → database → cloud hosting). Attach a system block diagram as an appendix if available.

[Maximum 200 words]

EventFlow AI adopts a web-based architecture that integrates frontend interfaces, backend services, artificial intelligence (AI) for proposal generation, and cloud-based database management to streamline and make event planning for both customers and business more efficient.

The frontend is developed using React and TypeScript provided in Replit, which is our Development Environment, providing two interconnected interfaces: the Customer Portal and Business Portal. Customers can submit event requests and requests to make changes through the Customer Portal; while business staff can manage requests, generate proposals, approve proposals and oversee event arrangements through the Business Portal.

Supabase, powered by PostgreSQL, serves as the backend database for storing and managing user profiles, event requests, updated changes, proposals, and event details. Supabase Authentication manages user login and registration, while Row Level Security (RLS) controls data and authorizes access based on user roles.

The system integrates an AI model hosted on RunPod to generate personalized event proposals based on customer requirements. Generated proposals are reviewed and managed by business staff before being approved and sent to customers.

Replit is used as the development and testing environment, while GitHub supports version control and team collaboration. Overall, the architecture enables seamless data exchange between customers, business staff, and AI-powered services.

2.2 Languages, Frameworks & Libraries

List the main programming languages, frameworks, and third-party libraries that your team did not create. Open-source use is permitted provided it is declared and properly licensed/attributed.

Name & Version	Purpose in Project	License
TypeScript (version to verify)	Main programming language used for frontend and backend development	Apache 2.0
React (version to verify)	Supports the interactive customer and business portal interfaces	MIT
Node.js (version to verify)	JavaScript runtime for the backend API server	MIT
Express.js (v5)	Backend framework for API routes, event processing and AI integration	MIT
Zod (version to verify)	Validating API requests and AI-generated proposal data	MIT
Drizzle ORM (version to verify)	Support database schema definitions and interactions with PostgreSQL	Apache 2.0
Wouter (version to verify)	Manages frontend navigation and routing between application pages	ISC
TanStack Query (version to verify)	Manages asynchronous data fetching, caching and synchronisation between the frontend and backend	MIT
Supabase JS (version to verify)	Connects Eventflow AI to Supabase for database operations and user authentication	MIT
Vite (version to verify)	Provides frontend development tooling and builds the web application	MIT
PostgreSQL	Relational database for storing customer information, event requests, proposals and event details	PostgreSQL License

3. APIs & Cloud Services

3.1 External APIs

List every external API your solution calls (GenAI, maps, payments, messaging, data feeds, etc.). Do not include API keys or secrets in this document.

API & Provider	Purpose in Project	Access Tier (free / paid / sponsor-provided)
RunPod API - RunPod	Connects application to the AI model to generate personalized event proposals based on customers preferences and updates	Sponsor-Provided
Supabase REST API - Supabase	Allows application to retrieve, store, update, and manage customer information, event details, event request and proposals in the database	Free
Supabase Auth API - Supabase	Handles user registration, login, authentication and session management for customers and business staff	Free

3.2 Cloud Platforms & Deployment

List every cloud service used for hosting, storage, databases, authentication, or compute, and indicate how the prototype is deployed.

Service & Provider	Purpose in Project	Plan / Region
Replit - Replit	Cloud-based development environment for building, running, integrating, testing and deploying the EventFlow AI web application	Plan and deployment region to verify
Supabase - Supabase	Cloud-based PostgreSQL database for storing user profiles, event requests, proposals, and event information	Free tier/ Region to verify
Supabase Authentication - Supabase	Provides cloud-based authentication and allow role-based access management, supported with PostgreSQL Row Level Security	Included with Supabase plan
RunPod - RunPod	Provides cloud computing infrastructure for hosting and running the AI model used for proposal generation	Paid/ GPU Region to verify

4. AI Tools, Models & Datasets

4.1 AI Models Used in the Solution

List every AI model embedded in or called by your application, including pre-trained, fine-tuned, and self-trained models.

Model & Version	Source / Provider	Usage (pre-trained / fine-tuned / self-trained)	License / Terms
Qwen3-8B	Qwen Team (Hosted on RunPod Serverless)	Pre-trained model used to generate personalised event proposals, including Plan A and Plan B, itemised budgets, and service recommendations. No fine-tuning performed.	Apache License 2.0

4.2 Datasets

List all datasets used for training, fine-tuning, evaluation, or in the running application. State clearly if a dataset contains personal or sensitive data.

Dataset Name	Source / URL	Type (public / private / self-collected / synthetic)	License	Personal Data? (Y/N)
EventFlow Customer and Event Data	Supabase PostgreSQL	Private	Proprietary	Y
Eventflow Business Data	Supabase PostgreSQL	Private	Proprietary	Y
EventFlow Test Data	Team-generated	Synthetic	Team-owned	N
EventFlow AI Synthetic Test Dataset	Self-generated by AI Model Development Team	Synthetic	Internally generated	N
EventFlow Event Request Data	Supabase PostgreSQL	Private / Synthetic	Team-Owned	Y
Event Planning Test Data	Team-generated	Synthetic	Team-Owned	N
EventFlow Proposal & Budget Data	Supabase PostgreSQL	Private / Synthetic	Team-Owned	Y

4.3 AI-Assisted Development Tools

Tools used to help write code, design, content, or documentation (e.g., chat assistants, code completion tools, image generators). Declaring these tools does not reduce your score; undeclared use may.

Did your team use any generative-AI tool to help create code, design, text, or other project material?

☑ Yes ☐ No

If yes, list them below:

Tool & Version	**Used For**	**Extent of Use (minor / moderate / major)**
ChatGPT (OpenAI)	Project planning, system architecture, debugging and API integration guidance	Major
Replit AI	AI-assisted code generation, editing and debugging within the Replit environment	Moderate

Briefly describe how your team reviewed, tested, and took responsibility for AI-generated output:

[Maximum 100 words]

Our team maintained human oversight throughout the AI-assisted development process by reviewing AI-generated code, debugging errors, and testing system functionalities to ensure reliability and accuracy. AI-generated event proposals were evaluated for relevance, budget accuracy, and alignment with customer requirements. Business staff were also given the ability to review and approve proposals before finalisation. Our team took responsibility for verifying AI-generated outputs, addressing inaccuracies, and ensuring that the final application met the project's objectives.

5. Sponsor-Provided Resources

Declare any official SDC sponsor-provided GenAI API, cloud credits, tools, mentoring, or data that your team used.

Did your project use any official SDC sponsor-provided resource?

☑ Yes ☐ No

If yes, list them below:

Sponsor	Resource (API / credits / platform / data)	How It Was Used in the Project
Replit	Sponsor-provided platform services and credits	Used to generate prompts to help assist in platform development
RunPod	Sponsor-provided GPU cloud credits	Used to host the Qwen3-8B model through RunPod Serverless for AI-powered event proposal generation

Was the sponsor resource essential to the core functionality of the prototype, or could it be replaced? Explain briefly:

[Maximum 100 words]

Sponsor-provided resources supported the development and core functionality of EventFlowAI. Replit facilitated application development, testing, and integration, while RunPod provided cloud computing resources to host the Qwen3-8B model for AI-powered proposal generation. Although RunPod's AI hosting capability was essential to the prototype's current implementation, alternative cloud platforms could provide similar services. Replit could also be replaced with other development environments. These sponsor resources accelerated development and reduced infrastructure costs without creating permanent dependencies.

6. Security, Privacy & Responsible Use

6.1 Data Handling & Privacy

What user or personal data does your application collect, store, or send to third-party services (including AI APIs)? How is it protected, and how long is it kept? State "No user data is collected" if applicable.

[Maximum 150 words]

EventFlow AI collects and processes user information, including names, email addresses, and event planning details such as event type, date, location, budget, guest count, and service requirements.

User profiles, event requests, proposals, and related records are stored in Supabase PostgreSQL. Supabase Authentication manages user registration and login, while Row Level Security (RLS) restricts database access based on user roles and permissions. Data is transmitted through HTTPS connections, and API credentials are stored in server-side environment variables to prevent exposure.

Event requirements may be transmitted to RunPod Serverless for AI-powered proposal generation. The application does not require payment card information.

As a hackathon prototype, formal data retention and deletion policies have not yet been established. Additional security testing, privacy safeguards, and data retention policies are required before production deployment.

6.2 Known Limitations & Risks

Identify the main technical limitations of your AI components (e.g., hallucination, bias, rate limits, dependency on a single provider) and any mitigation you have implemented.

[Maximum 150 words]

EventFlow AI relies on the Qwen3-8B model hosted on RunPod Serverless, which introduces potential limitations such as inaccurate pricing, unrealistic service recommendations, incomplete event details, and AI-generated hallucinations. The system also depends on third-party cloud services, which may experience API rate limits, cold-start delays, request timeouts, or temporary unavailability.

To mitigate these risks, the application incorporates structured proposal generation, input validation, error handling, and human oversight. Business staff can review and manage AI-generated proposals before they are presented to customers. Supabase Authentication and Row Level Security (RLS) provide additional safeguards against unauthorised database access.

The system has limitations in automated pricing verification, formal proposal rejection, and scalability. Further testing and improvements is required to evaluate AI accuracy, system reliability, security, and scalability before production deployment.

7. Compliance & Readiness Checklist

Tick all boxes that apply before submitting.

☑ All APIs, cloud services, AI tools, models, and datasets used in the project are declared in this document.

☑ All third-party code, datasets, and models are used in accordance with their licenses, and attribution is provided where required.

☑ No API keys, passwords, or other credentials are exposed in the code repository, prototype, or this document.

☑ Any use of generative-AI tools for development has been disclosed and reviewed by the team.

☑ Any use of official SDC sponsor resources has been declared in Section 5.

☑ The prototype described here is accessible to judges through the links provided in Section 1.

☑ All fields in this template have been completed within the word limits stated.

8. Declaration

By submitting this document, the team leader confirms that the information provided is complete and accurate to the best of the team's knowledge, and that every API, cloud service, AI tool, dataset, model, and sponsor resource used in the project has been declared.
