Republish
the existing RunPod proposal generator and Supabase persistence. No paid call was made.
Production site: The deployment reports a successful build; /api/healthz returns 200.
To enable generation
In Publishing → Adjust settings → Production app secrets, set both values to true:
EVENTFLOW_MVP_INSERT_VERIFIED=true
EVENTFLOW_LIVE_GENERATION_ENABLED=true
Save, then click Publish so the production app receives the new settings. Replit's publishing documentation describes this flow.
Once enabled, authenticated customer submissions can trigger RunPod jobs. The cap is five attempts total; failed or uncertain attempts count, and automatic paid retries are blocked. I have not set the flags or published.
