Rotary Club of Kuala Lumpur Dynamics

Rotary Club of Tun Razak Exchange

SDC Hackathon

Phase 1 : Preliminary Project Proposal

Hosted by Xiamen University Malaysia (XMUM) AI Club

Submission Deadline: 25 October 2026

Instructions: Complete every field below and submit as a single PDF document named “SDC2026_TeamName_Preliminary.pdf” before the deadline above. Answers must comply with the word limits stated for each open-ended question. Incomplete submissions may not be eligible for review.

SDC HACKATHON 2026

Phase 1: Preliminary Project Proposal

Hosted by Xiamen University Malaysia (XMUM) AI Club
Submission Deadline: 25 October 2026

Instructions: Complete every field below and submit as a single PDF document named "SDC2026_TeamName_Preliminary.pdf" before the deadline above. Answers must comply with the word limits stated for each open-ended question. Incomplete submissions may not be eligible for review.

1. Team & Project Overview

Team Name	NOVA
Selected Domain	Domain 2
Selected SDG Track (1–17)	SDG 8 & SDG 9
Project / Solution Name	EventFlow AI
Name (Leader)	Jeanette Tan Le Han
Email & Phone (Leader)	+60129250451
University Affiliation(s)	Xiamen University Malaysia
Number of Team Members	5

2. Executive Summary & Problem Statement

2.1 The Problem Context

Describe the specific, real-world challenge your team is tackling. Who is affected by this problem, and why does it matter? Highlight the critical social, environmental, or economic issues involved.

[Maximum 250 words]

Small-Medium Enterprise (SME) often relies on manual follow-up, checking with the lists and spreadsheets one by one and keeping an eye to customers' messages every second they could. But this might lead business owners facing challenges with minor or major errors, and even spending more time to keep track of their businesses. Which is time and manpower consuming. Such as chasing payments, missed deadlines, and lost track of stock and assets.

So, we aim to demonstrate our system by taking event organization as an example. As we know, every event depends on each single detail, starting up from budget, venue size, location, decoration, delicious meals supply and even a suitable date and time. All these details might be changing and being updated every second, and they have to be tracked carefully in order to not leave out any single details for the event. However, when information is tracked manually, it quickly becomes outdated. This will lead to miscommunication, erosion of trust because of being not professional and the worst, bankruptcy.

Unlike large companies, SME rarely have the budget to manage a professional system, enterprise level management systems, causing them to remain on track using the most traditional way.

Due to this issue, we aim to make a difference towards the SME industry by focusing on SDG 8 (Decent Work and Economic Growth), and SDG 9 (Industry Innovation and Infrastructure) as SME lack opportunity accessing affordable digital tools to make an increment towards the economy and exceed their productivity limits.

2.2 The Proposed AI Solution

Provide a high-level overview of your proposed application. How does it apply artificial intelligence to solve the problem stated above? Briefly mention the tools or technical skills gained from the SDC Phase 1 workshops (e.g., GenAI APIs, database architecture, cloud hosting) that you intend to leverage.

[Maximum 300 words]

We propose an AI-powered event management platform designed to simplify event planning for both customers and event service SMEs through a centralised system. Customers can specify their event requirements including budget, venue, catering preferences, and other services. Based on these inputs, the platform uses RunPod AI to generate personalised event proposals, helping customers explore suitable options more efficiently.

Our system consists of two main interfaces: a Customer Portal and a Business Portal. Through the Customer Portal, customers can submit their event preferences and review AI-generated proposals before communicating with the event service provider SMEs. Through the Business Portal, event service SMEs staff can review the generated proposals and decide to approve or reject the proposal. After approval, the system will automatically schedule the SMEs' calendar and update service availability.

To implement the solution, we intend to apply several technical skills gained from the SDC Phase 1 workshops:

1. Generative AI Integration: Use RunPod AI to generate personalised event proposals
2. Structured Prompting: Produce personalised event proposals based on customer requirements and preferences
3. Database Architecture: Use Supabase PostgreSQL to store and manage customer information and event details
4. Cloud Hosting: Use Runpod for AI-generated event proposals and Supabase for backend services
5. Human Oversight: Allow business staff to review and manage proposals before proceeding, while administrators approve business registrations to support the reliability and

accountability of the system.

By combining AI-generated recommendations, centralised data management, and human oversight, our system aims to reduce manual coordination, improve the organisation of event information, and make event planning more convenient and efficient for both customers and event service SMEs.

3. Technical Architecture & Implementation Plan

3.1 Conceptual Tech Stack

List the technologies, frameworks, APIs, and databases you plan to use to build a functional, deployed prototype. Describe (or attach as an appendix) a simple system block diagram showing how the workshop elements connect into one architecture.

Did your project utilize any official SDC sponsor-provided GenAI API or Cloud Platform? If yes, specify which one and how it is used.

The website produced by NOVA, EventFlow is a web-based platform developed using Replit that integrates frontend and backend technologies, database management, authentication, data security, and artificial intelligence (AI). The platform combines AI-powered event proposal generation with a centralized database and an interactive web interface to streamline event planning and communication between customers and businesses.

For development, Replit serves as the integrated development environment for developing, implementing, and testing the application, while GitHub provides version control and supports collaboration among team members during system development and integration. The frontend is developed using React to create interactive user interfaces, including customer and business dashboards, while TypeScript enhances code reliability and maintainability through static type checking.

For backend services, Supabase provides a PostgreSQL database to manage user profiles, event requests, generated proposals, and service availability, enabling data exchange between the Customer Portal and Business Portal. Supabase Authentication manages user registration and login, while PostgreSQL Row Level Security (RLS) controls access to database records based on user roles and permissions. Additionally, an administrator approval mechanism is incorporated into the system design to ensure that business accounts receive the necessary approval before gaining authorised business privileges.

For AI integration, RunPod provides cloud-based computing resources to support AI-powered proposal generation. Through Large Language Model (LLM) API integration and structured prompting, the system generates personalised event proposals based on

customer requirements, preferences, and event details. This integration aims to reduce manual proposal preparation and improve the efficiency of the event planning process.

3.2 Design-Thinking & Deployment Strategy

Explain how your team applied design-thinking methodology to ensure this solution is technically viable, user-friendly, and ready for real deployment by Phase 2.

[Maximum 200 words]

NOVA applied design thinking methodology to make sure the system we created is feasible and user-friendly. In order to help Small-Medium Enterprise (SME) to reduce manual tracking, enhance their working quality. NOVA began with understanding how risky it is a company relies on manual tracking. We then defined core problems such as miscommunication, inefficiency, and erosion of trust from customers. During the ideation period, we focus on AI-supported features that are able to be built such as automated tracking system, centralized customer database and also real-time availability checklists. According to this, we designed a simple interface that showcases how SME works with the automated system. Since training is needed, it is tested with users to refine feasibility and technical performance.

To be ready for deployment by Phase 2, we will finalise a cloud based web platform that needs no other special hardware and will be tested with simulated data to check its reliability and accuracy. At this phase, SMEs will be able to upload their existing spreadsheets, making it a smooth and easy transition.

4. Preliminary Environmental & SDG Impact Framework

To align with SDC's focus on meaningful global sustainability, establish your project's impact baseline before building the prototype. Use estimated data, published research, or public benchmarks where exact figures are unavailable. Provide the citation of any sources used.

The target, baseline, and KPI you provide here will be used by judges during shortlisting to assess ***Innovation and Creativity*** *as well as* ***Feasibility of build****. Vague or unsupported projections may weaken your case for advancing to Phase 2.*

Metric Category	**Your Response**
Target SDG Sub-Target(s) *Identify the exact UN SDG sub-target your project addresses* *e.g., Target 11.6 "Reduce the adverse per-capita environmental impact of cities, focusing on air quality and waste management."*	Target 8.3 "Promote development-oriented policies that support decent job creation, entrepreneurship, creativity and innovation, and encourage the growth of small- and medium enterprises, including through access to AI services"
Current Problem Baseline *What is the starting condition of the problem, expressed as a number?* *e.g., "The target infrastructure currently experiences 35% energy inefficiency due to unoptimized scheduling."*	The target users include 24% of SME still having to use pen and paper to manually keep inventory in check.
Core Measurable KPI *The specific unit you will track* *e.g., % reduction in power consumption, processing-latency improvement, or kg of resource waste avoided.*	40% reduction in paper and ink consumption, requirement of man-power and increasing use of digital data storage
Phase 2 Impact Target *Your realistic, percentage-based target by the final prototype presentation* *e.g., "20% improvement in computational resource use."*	

5. Eligibility & Readiness Checklist

Tick all boxes that apply before submitting.

☑ All team members have completed the mandatory GenAI, Database, and Cloud Deployment upskilling workshops.

☑ The project concept addresses a verified real-world problem mapped directly to one or more UN SDGs.

☑ The proposed solution targets a functional, deployed application rather than a theoretical business case study.

☑ All fields in this template have been completed within the word limits stated.

6. IP & Originality Declaration

6.1 Pre-Existing / Prior-Owned Work

Does this submission include any code, design, research, or other work that any team member created or owned before the start of this hackathon?

☐ Yes ☑ No

If yes, briefly describe what was pre-existing and which team member(s) owned it:

6.2 Third-Party Code, Datasets, or Models

Does your project use any third-party code libraries, open-source frameworks, public/private datasets, or pre-trained AI models that your team did not create?

☐ Yes ☑ No

If yes, list them below (open-source use is permitted provided it is declared and properly licensed/attributed):

Name	Type (code/dataset/model)	License

6.3 Employment-Related IP Conflicts

Is any team member currently bound by an employment, internship, or consulting agreement under which their employer could claim ownership of work they create during this hackathon?

☐ Yes ☑ No

If yes, please describe the nature of the agreement and which member it concerns:

7. Declaration

By submitting this proposal, the team leader confirms that the information provided is accurate to the best of the team's knowledge and that the project will be original work created during the SDC 2026 hackathon period.
